Architecture (one page)

Implemented = built and tested. **Proposed** = design only. Python computes every number; Claude writes; a second agent reviews; a human signs. Detail: `architecture_detail.md`.

Structure

Workbook → intake gate (stops, names the cell) → Python engine → review packet JSON → Claude drafts from the packet only → number grader + `finance-reviewer` agent → Excel pack → human approval locks the month.

Files

`clients/<id>/` config and workbook · `src/` engine · `scripts/` pipeline, approve, `regress.py` · `.claude/` skills, hooks · `03_evals/` 33 golden cases, 19 mutants, 32 faults · `outputs/<id>/` generated files · `01_connection/` QuickBooks MCP.

Skills

9 skills, 2 commands, 1 read-only reviewer agent. New skills follow `authoring_kit/` and stay Draft until golden, trigger and grader cases exist.

Memory

`CLAUDE.md` = rules; skills = procedure; `config.yaml` = client facts; `audit_log.jsonl` = what ran. **No cross-client memory**; one session per client and month.

Hosting

Implemented: one laptop, MCP over stdio, no listener. **Proposed:** shared host, one MCP process and token store per client, secrets manager, central audit (`connection_decision.md` §8). QuickBooks is sandbox-only and **not** an analysis input.

Ten clients: what changes

	Today	At 10	How
Credentials	1 sandbox grant	10 rotating tokens	One secret and process each; expiry alerts (Proposed)
Configs	3, hand-built	10 mappings to review	`CONFIG_REFERENCE.md`; human approves each
Runs	seconds offline	10 in one week	Batch runner (Proposed)
Review capacity	1 human per pack, unmeasured	the bottleneck	Severity ranking (Implemented)
Monitoring	files in `outputs/`	stale months, token age	Manifest dashboard (Proposed)
Cost	not measured	about 10× model calls	Measure tokens per run (Not done)

Data separation

Layer	Status
Config: file per client	Implemented
Outputs: audit hook blocks other clients' folders (14 tests)	Implemented, this Python process only
Process: account or container per client	Proposed
Credentials: hook blocks secret files; grant per client	Hook Implemented; grants Proposed
Model context: one packet; skill forbids other folders	Convention, not enforced
Logs: audit log per client	Implemented; central log Proposed

What breaks first

1. **Token upkeep:** a stale token silently stops a client. *Alerts; one writer per store.*
2. **Model-layer isolation:** Claude's tools share the OS user. *Container and session per client.*
3. **Reviewer capacity:** 10 packs, one week. *Triage by severity; measure.*
4. **Account mapping:** judgement, not checkable. *Human approval; prior-month diff.*
5. **Layout:** only one wide sheet; others are refused. *Adapter per layout.*
6. **Reviewer variance and one machine:** *grader floor, human sign-off; shared host, backups.*
